

# BROADBAND

In Finland, both coverage and quality of telecommunications networks is excellent and practically everyone has access to a broadband connection. Finnish telcos invest nearly 500 million euro in the construction of fixed and mobile networks each year.

## Investments | Fixed networks

## Fixed broadband technologies

Fibre connection

57 %

Cable modem

26 %

DSL connection

15 %

+ 1 % others

## Mobile broadband subscriptions

Unlimited data transmission

85,3 %

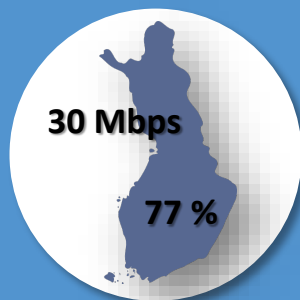

Limited data transmission

14,7 %

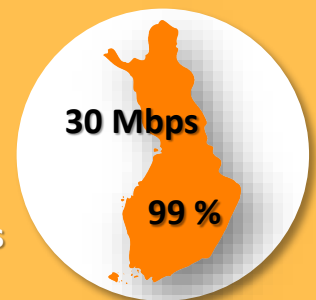

**30 Mbps** fixed broadband connection is available for **77 %** of Finnish households.

**65 %** of households had access to fixed broadband connection of min. **100 Mbps** at the end of 2020.

**30 Mbps** mobile broadband connection is available almost everywhere in Finland.

**93 %** of households had access to 4G mobile broadband connection of min. **100 Mbps** at the end of 2020.

New fixed broadband connections are usually fibre-based. **Optic fibre** is replacing copper and cable in residential networks for virtually all new construction.

**Fibre is the backbone of telecommunication networks** and 5G base stations are also built on fibre.

The new generation of mobile network **5G** offers low latency, high capacity and increased bandwidth for new applications and services.

**5G** enables super-fast **fixed mobile broadband** – almost as fast as fibre connection.
